

ABSTRACT OF THE DISCLOSURE

A printing machine is provided with a control panel for use in the printing machine's control. The control panel is located on one side of the printing machine which includes at least one printing unit which has at least one pair of cylinder. This at least one pair of cylinders are mechanically coupled to each other by a drive connection and are driven for rotation by a drive motor that is independent of other printing units. This drive motor and the drive connection are located on the control panel side of the printing unit.
